

A place for papers

This is a real PDF, ready to travel between your devices.

Your app lives on GitHub Pages.

Your documents live in a separate private GitHub repository.

A cached copy lives here, so you can keep reading offline.

Try it

Connect your private library, then upload this sample.

On another device, connect the same repository and refresh.

Choose the paper to download, check, and read its original bytes.

Assets, not settings

A location tells an app where something lives.

An asset is the actual thing: a paper, recording, image, or project.

What goes where

Repository: original PDFs and small metadata records.

This browser: cached PDFs and your place in each paper.

State: the library location, separate from large asset bytes.

Memory: your repository key, forgotten when you disconnect.

Make it yours

The same library can serve multiple devices.

Git records each addition; identical papers share one path.

Keep your repository private and your key out of exported state.
